

## **CTRad radiotherapy protocol checklist**

Developing a radiotherapy protocol for a clinical trial is an important step towards delivery of high quality radiation therapy within the trial whether the key question that the trial is addressing is directly radiotherapy related or not. This document has been developed by the NCRI Clinical and Translational Radiotherapy Research Working Group (CTRad)'s workstream for phase III trials and is designed as a guide to the key components of such protocols.

It is recognised that the radiotherapy to be delivered within a clinical trial will vary in its complexity, that not all components of the checklist are important for all tumour sites, and that there are many different issues which may arise during protocol development. It is recommended that the detailed description of radiotherapy planning, treatment delivery and quality assurance is included in a standalone radiotherapy guidance document. This should be developed in parallel with the clinical trial protocol and in collaboration with the National Radiotherapy Trials Quality Assurance (RTTQA) group with input/review by key investigators at participating sites.

| Component  | Items to consider   | Included?<br>(Yes / No/<br>N/A) |
|--|---|---------------------------------|
| Immobilisation,<br>simulation and<br>target localisation | Patient positioning and immobilisation technique (if used)  |                                 |
|  | Use of planning CT and/or MRI scan  |                                 |
|  | Use of oral or IV contrast  |                                 |
|  | Scan limits and slice thickness   |                                 |
|  | Scanning sequences (if MRI)   |                                 |
|  | Patient preparation protocols e.g. bladder filling instructions, enema, laxatives   |                                 |
|  | Techniques to compensate for internal organ motion e.g. '4D'<br>CT, gating, tracking, breath-hold and/or use of abdominal<br>compression device |                                 |
|  | Image registration with other modalities e.g. PET, SPECT, MRI   |                                 |
| Target volume<br>delineation and<br>treatment planning   | GTV<br>• Definition of GTV  |                                 |
|  | Other investigations/information needed for adequate GTV definition   |                                 |
|  | Use of CT windowing   |                                 |
|  | CTV   |                                 |

| Component  | Items to consider   | Included?<br>(Yes / No/<br>N/A) |
|--|---|---------------------------------|
|  | <ul> <li>Margins used to expand GTV to CTV</li> </ul>   |                                 |
|  | <ul> <li>CTV definition if a GTV is not defined (e.g. post surgery)</li> </ul>  |                                 |
|  | Use of elective nodal irradiation or not  |                                 |
|  | <ul> <li>PTV</li> <li>Margins used to expand CTV to PTV</li> <li>Note: These depend on the immobilisation/technique used and audited in house.</li> </ul>   |                                 |
|  | TV     Definition of ITV  |                                 |
| Organs at risk                                   | <ul> <li>Definition of TV</li> <li>If ICRU GTV/CTV/PTV concept not used explain why e.g.</li> <li>palliative treatments, and define how field borders are placed</li> <li>Organs at risk (OAR)</li> </ul>                               |                                 |
|  | Definitions of OAR e.g. rectum from recto-sigmoid junction to<br>anus vs defined amount above and below PTV   |                                 |
|  | Margins and their growth for OARs particularly in reference to IGRT   |                                 |
| Target volume and<br>OAR naming                  | Use standard naming convention for all target volumes and OARs. The RTTQA group at <u>rttrialsqa.enh-tr@nhs.net</u> can advise on this.   |                                 |
| Prescribed dose<br>and fractionation<br>by phase | Dose (Gy) and prescription point e.g. isocentre or prescription<br>isodose. For IMRT the prescription should be dose to<br>mean/median of PTV.  |                                 |
|  | Multi-level dose prescriptions (e.g. for SIB)   |                                 |
|  | Number of fractions, number of treatments per day,<br>interfraction gap if >1 fraction/day, overall treatment time e.g.<br>50Gy in 25 x 2Gy fractions, treating once daily Monday-Friday<br>over 5 weeks                                |                                 |
| Dosimetry/dose<br>specifications                 | Planning algorithm (use of inhomogeneity correction,<br>superposition/convolution algorithms, Monte Carlo,<br>algorithms taking lateral electron transport into account)<br>Imaging for dose calculation (e.g. CT or sCT from MRI, etc) |                                 |
|  | IMRT (forward/inverse) or 3D conformal  |                                 |
|  | VMAT/RAPIDARC/TOMOTHERAPY (dose constraints will be different)  |                                 |
|  | Number of beams   |                                 |
|  | Co-planar/non co-planar   |                                 |
|  | Beam arrangement - mandated or recommended?   |                                 |
|  | Beam energy - mandated or recommended?  |                                 |

| Component                         | Items to consider  | Included?<br>(Yes / No/<br>N/A) |
|-----------------------------------|--|---------------------------------|
|                                   | Any specific consideration for density overrides (IV or oral contrast, metal implants, gas, etc)   |                                 |
|                                   | Beam shaping e.g. MLC  |                                 |
|                                   | Size of MLC leaf specified - e.g. 5mm/10mm etc.  |                                 |
| Dose/volume<br>constraints        | <ul> <li>Max, min and median doses in target; homogeneity and conformality for multi-level plans</li> <li>Dose constraints for PTV?</li> <li>(Normally would be ICRU recommendations but may need to be relaxed / specified particularly in the thorax if type B calculation algorithms used.)</li> <li>Specific OAR DVH constraints (recommended or absolute)</li> </ul>                        |                                 |
| Brachytherapy                     | Pre-treatment requirements   |                                 |
| Баспуспетару                      | Use of temporary or permanent implants   |                                 |
|                                   |  |                                 |
|                                   | Source used and dose rate (LDR, MDR, HDR, PDR)   |                                 |
|                                   | Patient preparation, anaesthesia and positioning   |                                 |
|                                   | Planning imaging and use of image fusion (X-ray, CT, US, MRI)  |                                 |
|                                   | Definitions of GTV/CTV/PTV/at risk volumes and planning<br>objectives  |                                 |
|                                   | Definitions of OAR and planning constraints; handling of combined EBRT and brachytherapy doses.  |                                 |
|                                   | Use of pre-plan, interactive and post implant dosimetry  |                                 |
| On treatment<br>verification/IGRT | <ul> <li>Specification, e.g. EPI, helical CT, cone beam MV or KV CT, planar kV, fiducials, MRI</li> <li>Frequency of imaging, offline vs. online pre treatment, intrafraction motion monitoring</li> <li>Action levels,</li> <li>The justification for increased imaging dose should be considered.</li> </ul>   |                                 |
|                                   | In-vivo dosimetry (diode, TLD, EPI)  |                                 |
|                                   | Action protocols to be used.   |                                 |
|                                   | <ul> <li>Adaptation strategy:</li> <li>type of anatomical change (e.g. tumour shrinkage, tumour drift, weight loss, or internal motion)</li> <li>Frequency of adaptation (none, intermittent or daily)</li> <li>Type of adaptation (e.g. plan of the day, adapt to position or to shape; reactive or proactive).</li> <li>Reporting of delivered dose if adaptive strategies are used</li> </ul> |                                 |

| Component   | Items to consider   | Included?<br>(Yes / No/<br>N/A) |
|---|---|---------------------------------|
|   | Field reductions allowed or not   |                                 |
| Treatment delays  | Compensation for delays (e.g. use of 2 fractions per day)   |                                 |
| Patient care during treatment                           | Patient preparation protocols on treatment (e.g. rectal or bladder filling)   |                                 |
|   | Management of changes in organ filling position (e.g. altered drinking protocols  |                                 |
|   | Any special requirements  |                                 |
| Systemic therapy  | Scheduling of RT and chemotherapy or other drug dosing in trials of chemoradiotherapy or RT-drug combinations   |                                 |
|   | Action to be taken if toxicity is seen  |                                 |
| Centre<br>credentialing (pre-<br>study)                 | Contact the RTTQA Group <u>rttrialsqa.enh-tr@nhs.net</u> to discuss<br>the appropriate level of QA support, estimated costs, and<br>participating centre credentialing process, |                                 |
|   | All centres in all trials coordinated by the RTTQA group must have completed the baseline questionnaire available at <u>www.rttrialsqa.org.uk</u>                               |                                 |
|   | Streamlining with other ongoing studies   |                                 |
|   | On trial RT data & imaging collection   |                                 |
| Phantom studies,<br>contouring and<br>planning dry runs | These should be specified in the protocol or QA documents   |                                 |
